Aastra Telecom is pleased to announce the availability of a new software update for our Enterprise IP portfolio of telephones, including the Model 480i, 9133i, 9112i and 480i CT.

Release 1.3 delivers new features and enhancements including:

- **Extensible Markup Language (XML)** support to allow users to create and access custom services via the phone user interface. These services may include applications like weather and traffic reports, contact information, company announcement, stock quotes, or custom call scripts.
- Enhanced integration to BroadSoft BroadWorks® and Digium Asterisk™ platforms with **Busy Lamp Field (BLF)** feature support. This feature allows an administrator/attendant to see the status (busy or idle) of another party before transferring the call.
- **Multiple SIP Proxy** support to consolidate different SIP accounts onto a single IP phone platform thereby allowing users to make and receive calls from their office and personal accounts from a single device.
- **Telephony enhancements** such as phone-side call forwarding, Do Not Disturb (DND), and missed call indicator.
- **New mass deployment features** including support for downloading a centralized corporate directory, outbound proxy for Session Border Controller deployments, NAT traversal, VLAN tagging and QOS marking, and a new web user interface.
- **New security features** including encrypted configuration file support and alternate download methods including FTP, HTTP, and TFTP.

Details on these and other new features can be found on our website at www.aastra.com/IPPhones. Select the Service & Support menu (Downloads, Software Downloads) and your phone model to obtain this new firmware.
